

Vigil24 product brief

A concise overview of the platform and its governance workflow.

PRODUCT BRIEF

AI governance, one system at a time.

Every AI system and every AI tool gets one living record: owner, purpose, context, risk, policy, controls, evidence, approvals and lifecycle history.

Why teams use it

One register. Registered and discovered AI enters one queue. One process. Seven steps move each record from registration to reassessment. Two human gates. Governance review and final sign-off keep material decisions with accountable people. One audit trail. Actions, evidence and blocked attempts are recorded as the work happens.

The seven-step lifecycle

Step	Stage	What happens
01	Register	Manual or discovery.
02	Add context	Purpose, data, users and fallback.
03	Plan	Risks, clauses and controls.
04	Governance review	Plan locked for review.
05	Verify	Run controls and attach evidence.
06	Final sign-off	Readiness checked.
07	Monitor	Reassess after change.

Platform coverage

AI system registry · Shadow AI discovery · Governance planning · Controls and evidence · Two-stage approval · Exceptions and deferrals · AI card · Vendor registry · AI spend and usage · Exports and API.

Important boundary

Vigil24 tracks governance controls. It does not monitor model performance or drift, test or red-team models, certify compliance, or guarantee audit acceptance.

See it on your own system
